TRACKING & ATTRIBUTION ARCHITECTURE

Every booking attributed. Every source accounted for.

A strategic response to Silver Mirror's attribution gaps — covering high-intent tracking, UTM persistence through the booking engine, AI traffic measurement, and entity clarity across all locations.

Server-side first

Persistent attribution that survives cross-domain handoffs and booking engine transitions.

AI traffic native

ChatGPT, Gemini, Perplexity, Copilot — tracked, labeled, and attributed through to booking confirmation.

Entity clarity

One canonical brand identity across all locations — stopping AI hallucinations and competitor substitution.

ATTRIBUTION & TRACKING

High-intent engagement tracking

We define real intent signals with your team and capture them through a CDP — filtering out bots and scrapers, measuring what actually predicts a booking.

UTMs persisting into the booking engine

PostHog persists UTMs natively across the session with a server-side cookie fallback — source attribution never drops at the booking handoff.

Cross-domain session continuity

GTM configured for wildcard domains plus PostHog session profiling — one unbroken user journey from silvermirror.com through book.silvermirror.com to confirmation.

Accurate ROAS + channel contribution

Server-side tracking paired with Conversions API gives you clean attribution across paid, organic, direct, and referral — no fragile front-end tags, no self-referral inflation.

Our position on the "Safe Fix" approach: front-end GA4 patches are fragile by design. Text-highlight events and lookup tables don't solve the underlying data continuity problem. The right fix is server-side infrastructure — built once, reliable permanently.

AI TRAFFIC & ENTITY CLARITY

AI-assistant impact on bookings

Once server-side is live, your analytics stack natively reports AI-sourced bookings and revenue — no manual lookup tables, no forced parameters, no fragile workarounds.

Detect ChatGPT / Gemini / Perplexity / Copilot

We capture UTMs natively passed by AI platforms on click-through and pair it with AEO tooling — clean, current data without manual referrer tables that go stale.

AI-influenced booking intent

PostHog persists user identity and origin across the full session — the AI-to-intent journey captured in a single clean event, from first AI click to "Book Now".

AI-attributed conversions

The original AI source is stored server-side and fires on booking confirmation — the attribution loop closes completely, every time, regardless of session length or redirects.

Entity clarity across all locations

One canonical Organization schema with proper parent-child location structure, consistent NAP across directories, and Wikidata anchoring — stopping AI hallucinations and competitor substitution cold.

ONE-TIME IMPLEMENTATION

Everything needed to go from fragmented, front-end dependent tracking to a reliable, server-side attribution stack.

- **Full tracking audit** — GA4, GTM, booking engine, and cross-domain setup reviewed against your existing UTM governance framework
- **Server-side infrastructure** — Conversions API integration for paid channels (Google, Meta), persistent attribution through the booking flow
- **CDP deployment** — RudderStack configured for real user profiles, behavioral data capture, and bot filtering
- **PostHog implementation** — session persistence, cross-domain continuity, and AI source tracking end to end
- **UTM governance activation** — your existing naming framework wired into the tracking stack so it works in practice, not just on paper
- **Entity and schema cleanup** — canonical Organization schema, parent-child location structure, NAP consistency across directories
- **Baseline reporting setup** — dashboards in PostHog or Looker showing AI traffic, channel contribution, and booking attribution from day one

MONTHLY RETAINER SCOPE

Ongoing attribution integrity as your campaigns, locations, and booking stack evolve.

- **Tracking health monitoring** — across all domains and the booking engine, with alerts on attribution drift
- **UTM governance audits** — reviewing new campaigns before launch to ensure attribution integrity across all channels and agencies
- **Monthly attribution report** — channel contribution, AI traffic impact, and ROAS by source delivered to your team
- **PostHog + CDP maintenance** — event schema updates as the site or booking flow changes, keeping data clean
- **AEO monitoring** — AI citation accuracy, entity consistency, new hallucination patterns flagged and corrected
- **Schema and directory maintenance** — entity signals kept clean as locations, services, or pricing change
- **Funnel drop-off analysis** — surfacing where attributed sessions are falling out of the booking flow each month

NEXT STEP

A 45-minute discovery call to scope the full architecture.

We'll walk through your current stack, map exactly where attribution is breaking, and give you a concrete implementation plan — no commitment required.
